How to use the planner

Two minutes at the start of the week and ten seconds a day.

1. **Start from your own dates.** Day 1 of the cycle is the first day of your period. Write the date and the cycle day for each column.
2. **Plan with a light touch.** For each of workout, focus work, big decisions and rest, mark the days that look good, so-so or not ideal. These are starting points, not rules.
3. **Check in each evening.** Circle energy, focus and mood from 1 to 5 and note whether the plan fit. It takes about ten seconds.
4. **Look back after two or three cycles.** Fill in the table below with what you actually noticed. Your own notes are the data.

Cycles vary: sources describe lengths from about 21 to 38 days, and a cycle can change from month to month. The evidence on whether cycle phase changes performance is limited and mixed, so treat phase-based planning as an experiment and not as a rule. This planner doesn't diagnose anything. If something about your cycle worries you, talk to a doctor.

What I noticed

Phase	Energy and focus tended to be...	What worked well	What I'd do differently
Period			
Follicular (after the period, before ovulation)			
Around ovulation			
Luteal (after ovulation, before the next period)
